RESTORE DRILL EVIDENCE

Example Co

1 October 2026 to 31 October 2026 · all times UTC

158	157	1	4
Drills received	Passed	Failed	Databases

1 drift finding · 2 missed-window alerts

1 database sent no reports in this period

Report chain intact

158 hashed reports were checked. Each is linked to the one before it, so a changed or removed report would show.

NEWEST REPORT HASH · RECEIVED 31 OCT 2026 18:32 UTC

`386bb8bb565e4fe6ede791da54eaef710c14e229c791e8f01ffe940b559cbcfb`

Write this down. If a later copy cannot show a report with this hash, reports were changed or removed.

SAMPLE PACK, MADE-UP DATA

Every name, number and hash in this file is made up, to show what a monthly pack looks like. An issued pack shows its verification address here.

Generated	1 November 2026, 00:05 UTC
Issued by	restoredrill.io
Pack ID	SAMPLE

Failed-check details in this document are copied from the reports and can name hosts, paths or tables. Check them before sharing this file outside your organization.

reporting

No restore drill reports were received from this database in this period.

Findings in this period

PASSED DRILLS THAT DIFFERED FROM EARLIER RUNS

2026-10-21 12:31 UTC billing: The backup is 212.4 MiB, down from a typical 486.0 MiB (56% smaller).

DATABASES THAT STOPPED REPORTING

2026-10-03 05:00 UTC reporting: no report after 2026-09-25 04:00 UTC. Alert sent.

2026-10-20 05:00 UTC analytics: no report after 2026-10-12 04:00 UTC. Alert sent.

What this document is evidence of

This document records restore tests that the customer ran with restoredrill, an open source tool. For each test, restoredrill restored a backup into a throwaway database, ran the checks the customer configured, and reported the result. restoredrill.io stored each report when it arrived and linked it to the one before it.

Auditors commonly look for evidence of tested backups and recovery in these places:

SOC 2	Trust Services Criteria A1.2 (backup processes and recovery infrastructure) and A1.3 (testing of recovery plan procedures).
ISO/IEC 27001:2022	Annex A control 8.13 (information backup).
AWS FTR	The Foundational Technical Review requirement that backups are tested by restoring them.

This document is not a certification and does not say that any control is met. It covers restore tests of the databases listed here, not other systems, and not the quality of the data. The auditor decides what it counts for.

How to check a run

A run's hash is a SHA-256 over these lines, in order, each ending with a newline: the customer number, the time the report arrived in Unix seconds, true or false for the result, and the previous report's hash (empty for the first). The report's raw bytes follow directly after. Ask the customer for the raw report to recompute it.

This is a sample with made-up data and has no verification address. An issued pack carries one, and its SHA-256 can be checked there.

Run hashes

Each hash covers the customer number, the time the report arrived, its result, the previous report's hash and the report itself.
